

Project For FlowZint AI Hackathon 2026

market sales bot

main 2 function

< outbound call with lead

<analysis sales call and find leads and cons.

type 1

An AI system that automatically talks to leads over phone calls, qualifies them, and analyzes the conversation to help sales teams close better.

That breaks into 2 big systems:

1. AI Voice Calling Agent (Outbound Caller)
2. AI Sales Intelligence Analyzer

AI that calls leads, qualifies them, and tells sales teams who is most likely to convert.

Build THIS instead:

MVP FEATURES

1. AI Outbound Calling

AI calls lead automatically.

During call:

- Introduces company
- Talks naturally

- Asks qualification questions
- Collects responses
- Detects interest level
- Books callback/demo

2. Call Transcription

Convert voice → text in real time.

3. AI Conversation Analysis

After call:

- sentiment analysis
 - lead scoring
 - objection detection
 - buying intent detection
 - summary generation
-

4. CRM Dashboard

Simple dashboard:

- lead list
- call recordings
- transcripts
- lead score
- hot/warm/cold classification

Summary of the full project

Here's everything from this conversation in one place:

Project: FlowZint — AI sales bot for the FlowZint AI Hackathon 2026. Two core systems: an AI that calls leads and qualifies them, and an AI that analyzes the call and tells your sales team who to chase.

Tech stack decided:

- Telephony: Twilio (PSTN) + LiveKit (local media server) + ngrok (dev tunnel)
- Voice AI: GPT-4o Realtime API (conversation brain) + ElevenLabs (voice synthesis)
- Transcription: Deepgram (live STT during call)
- Analysis: Claude API with structured JSON output (post-call — lead score, sentiment, objections, intent, summary)
- Backend: FastAPI (Python) — single service handling the Twilio webhook, WebSocket bridge, LiveKit session, and DB writes

- Database + storage: Supabase (Postgres + file storage for recordings + realtime subscriptions)
- Frontend: Next.js + Recharts + Shadcn/ui
- Auto-booking: Calendly API triggered when lead score is high

Call state machine: Intro → Qualification → Objection handling → CTA → Close. Keeps calls consistent and analysis structured.

Diagram 1 — High-level system overview. Three major zones: the telephony layer, the AI brain, and the data/dashboard layer.

[Click any component to explore it ↗](#)

Diagram 2 — Live call pipeline. What happens from the moment a lead is dialed to the moment the transcript hits the database.

Diagram 3 — Post-call analysis + CRM write. What happens after the call ends: Claude analyzes the transcript and the dashboard updates in real time.

version 2

Diagram 1 — Multi-tenant platform structure. How businesses, the super admin, and isolated workspaces fit together.

Diagram 2 — Agent configuration pipeline. How a business's form + document gets turned into a live, personalized voice agent.

Diagram 3 — Conversation quality scoring. How the system measures whether the agent actually performed well for that business's goals.

Full updated system summary

Here's what the complete FlowZint platform now looks like based on all your decisions:

Multi-tenancy is handled with Supabase Row-Level Security. Every table (leads, calls, analysis, agent_configs) has a tenant_id column. A business can only ever see rows matching their own ID — enforced at the database level, not just in the frontend.

Business registration flow: Business signs up → fills company info → your super admin gets notified → you approve → their workspace activates. You can build the approval UI as a simple admin-only Next.js page showing pending registrations.

Agent configuration works in two steps. First, the business fills a form: company name, product description, tone (formal/casual/friendly), qualification questions (up to 5), common objections + how to handle them, and language selection. Second, they optionally upload a PDF/DOCX sales playbook — Claude reads it and extracts additional context, which gets merged into the system prompt automatically.

Language support is handled by setting the GPT-4o system prompt language and ElevenLabs voice language per tenant. Deepgram also supports multilingual STT — you just pass the language parameter at session start. Each business picks their language(s) during setup; the agent switches automatically.

Conversation quality scoring runs after every call. Claude receives both the transcript AND the business's configured script/goals, then scores: script adherence, talk ratio, objection handling quality, and CTA delivery. This score sits alongside the lead score in the dashboard, so businesses can see not just "did the lead convert?" but "did our agent perform well?"

Key new Supabase tables to add:

- tenants — business profile, approval status, plan
- agent_configs — system prompt, state machine JSON, language, version history
- call_quality_scores — per-call agent performance metrics

phase

Phase 1 Project foundation

Day 1 — 3–4 hrs

☐ Next.js + FastAPI project setup

☐ Supabase schema + RLS policies

☐ Core tables: tenants, agent_configs, leads, calls

☐ Supabase Auth — business + admin login

Phase 2 Business onboarding + agent config

Day 1–2 — 4–5 hrs

☐ Business registration form

☐ Super admin approval panel

☐ Agent config form — tone, script, questions

☐ Playbook PDF upload + Claude parser

☐ Prompt builder — merge form + doc

☐ Language selector per tenant

Phase 3 AI calling agent

Day 2–3 — 6–8 hrs

☐ Twilio outbound call + Media Streams

☐ LiveKit local server + Twilio bridge

☐ GPT-4o Realtime agent — LiveKit plugin

☐ State machine — 5 call stages

☐ ElevenLabs TTS — multilingual voice

☐ Deepgram live STT stream

☐ Load tenant config at call start

☐ Save recording + transcript to Supabase

Phase 4 AI analysis + quality scoring

Day 3 — 3–4 hrs

☐ Claude lead analysis — JSON output

☐ Claude agent quality scorer

☐ Auto-trigger analysis on call end

☐ Calendly auto-booking for hot leads

Phase 5 CRM dashboard

Day 3–4 — 4–5 hrs

☐ Lead list — score + Hot/Warm/Cold

☐ Call detail — transcript + analysis

☐ Live transcript on active calls

☐ Agent performance tab

☐ Supabase realtime — no-refresh updates

☐ Call recording audio player

Hackathon demo script (5 minutes)

1. Show business onboarding — fill form, upload playbook, pick language
2. Add a lead — trigger auto call
3. Live call plays — transcript streams on screen in real time
4. Call ends — lead score + agent quality score populate dashboard
5. Hot lead → Calendly booking fires automatically
